Week 2 Coding Challenge Summary

Oct 19, 2026 · @Robert

The challenge: write a product requirements document (PRD) for an app that helps people with ADHD budget their money. A PRD explains what problem an app solves, who it is for, what it will do, and how we will know it worked.

This week I added **9 product management skills** to Claude Code and used them to research the market and write the PRD.

The 9 skills I added

All nine come from one collection, *pm-skills* by Paweł Huryn (Product Compass), so their templates fit together.

Market research (4)

Skill	What it does	How I used it
market-sizing	Estimates how big a market is (TAM, SAM and SOM), with sources	How many adults with ADHD need budgeting help
competitor-analysis	Compares competitors' strengths, weaknesses and prices	How today's budgeting apps fall short for ADHD users
user-personas	Builds research-based personas with their jobs, pains and gains	Who the app is for and what gets in their way
customer-journey-map	Maps each step from first hearing about an app to recommending it	Where people with ADHD give up on budgeting tools

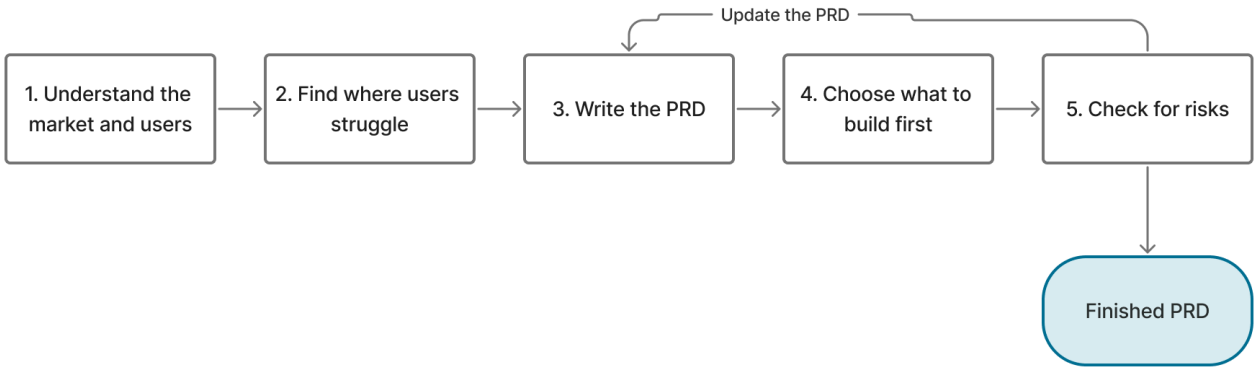

Product management (5)

Skill	What it does	How I used it
create-prd	Writes a lean, 8-section PRD	**The main deliverable**
value-proposition	Explains why someone would choose this app over others	The PRD's value proposition section

Skill	What it does	How I used it
user-stories	Turns features into "As a…, I want…, so that…" stories	Breaking features into buildable pieces
prioritize-features	Ranks features by impact, effort and risk	Deciding what goes in version 1
pre-mortem	Imagines the launch failed and lists what could cause it	Stress-testing the PRD for risks

My workflow

1. **Understand the market and users:** market-sizing → competitor-analysis → user-personas.
2. **Find where users struggle:** customer-journey-map.
3. **Write the PRD:** value-proposition → create-prd.
4. **Choose what to build first:** prioritize-features → user-stories.
5. **Check for risks:** pre-mortem, then update the PRD.

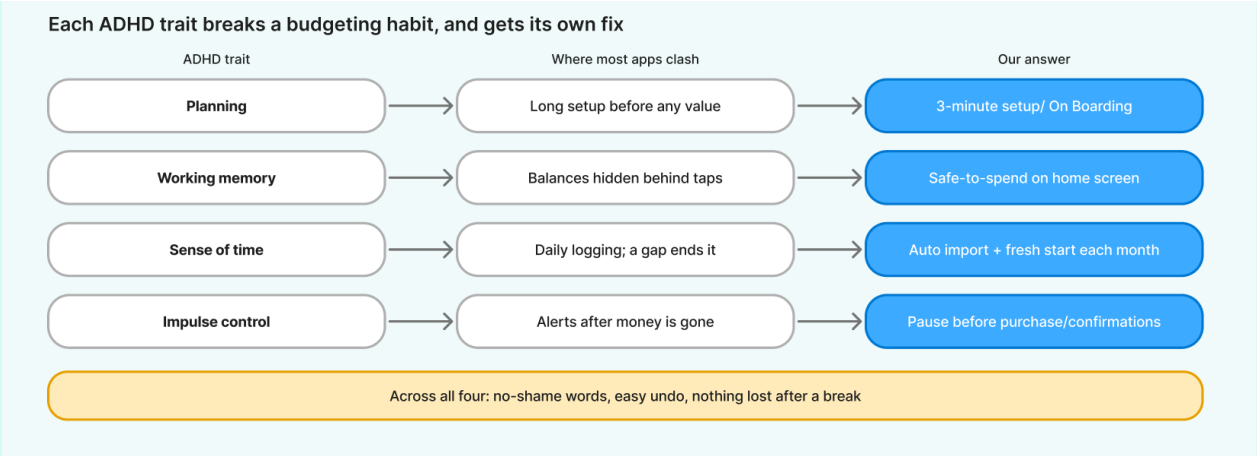

My five steps. Checking for risks sent me back to update the PRD before it was finished.

What the PRD says

The problem. About 1 in 14 adults (roughly 366 million people) has ADHD. Budgeting apps assume steady attention and daily habits, which ADHD makes hard. They fail in four ways:

1. **Too much setup:** long category lists drain motivation before the app is useful.

2. **Out of sight, out of mind:** balances hide behind taps.
3. **Daily habits required:** manual logging breaks the first time someone misses a few days.
4. **Shame after a slip:** red numbers and broken streaks push people away.

How each ADHD trait clashes with budgeting apps, and the answer we planned at the time, from my FigJam research board.

Who it's for.

- **The overwhelmed restarter:** has tried 2 or more budgeting apps and quit each within weeks.
- **The surprise-hit spender:** keeps getting caught by forgotten bills, subscriptions and impulse buys.

The two audiences, with their motivations and goals, on my FigJam research board.

Value proposition. For adults with ADHD who keep falling off budgets, our app shows what is safe to spend in one glance and welcomes you back after any break, so staying on top of money takes minutes, not willpower.

Competitors. Money apps (YNAB, Monarch, Rocket Money, PocketGuard, Copilot, EveryDollar) have the tools but not ADHD-first design. ADHD apps (Tiimo, Inflow) have the design but no money features. Our edge is coming back after a break, a pause before impulse buys, and calm design.

How we'll know it worked (first 3 months of the beta):

Goal	Target
New users still active in week 4	40%
Users who stop for a week or more and come back within 30 days	60%
Fewer late fees or overdrafts (month-3 survey)	30% fewer

Release plan. Discovery first, then a closed beta (MVP #1), then the public launch (MMP). Each step has a "gate" we must pass before moving on.

Not in the first version: investing, credit scores, detailed reports, streaks, financial advice, couples mode, coach sharing and savings goals.

How I checked the skills for safety

Each skill went through the same four checks as Week 1: the installer's automatic scan, a source check, reading it myself, and a conflict check.

- Five skills were rated Low and four were rated Medium.
- I accepted the Medium ratings because every skill is a single text file with no scripts, downloads or password requests. The Medium ratings matched exactly the skills that tell Claude to research the web, which these tasks need.
- The source collection is original (not a copy), actively maintained, and has about 27,000 stars on GitHub.
- No conflicts: these skills don't overlap with the Week 1 design and coding skills.

What I learned

- Research comes before writing: market size, competitors and personas gave the PRD real evidence instead of guesses.
- A lean PRD is easier to read and act on than a long one.
- A pre-mortem catches risks while they are still cheap to fix.

Where to find it

The skills, their sources and the safety review are in the **Week 2 Coding Challenge** folder of my GitHub repository: github.com/willsrobjr124/AI-Development-Residency. The PRD carried into Week 3, where it became the build plan, technical requirements and backlog.
